

Evaluation of raw materials

Niebling Technische Bürsten GmbH

Industriestraße 12
91593 Burgbernheim
Germany

Fyens Børste- & Kostefabrik ApS has requested an evaluation of their various raw materials in order to set up a test scheme to cover all products made of different blocks and filaments.

Eurofins Product Testing has taken contact to the raw material manufacturers and gathered all relevant information on the resins and masterbatches used for the various products including information on identities and amounts substances restricted by specific migration limits and dual use additives in the raw materials.

Based on this information the finished products have been divided into groups of products that contain the same chemical substances. From each group the worst case representative has been selected for test.

The tests cover the following groups:

Test report no. G22431 - test of black block material - covers black blocks

Test report no. G22432 – test of yellow block material – covers yellow, blue, purple, white, grey and brown blocks

Test report no. G22433 – test of red block material – covers red, orange and green blocks

Test report no. G22434 – test of orange filaments – covers orange, black, purple, white, red, yellow, blue, green, grey and brown filaments.

The products have been tested for overall and specific migration and all results are in compliance with the limits given in Regulation 10/2011/EC as amended.

Do not hesitate to contact me if you have any questions.
